

# Ambulatory Tremor Monitor

- Determination of low- and high frequency tremor and amplitude
- Graphic presentation of tremor frequency and intensity during the whole measurement
- Calculation of average tremor frequency and duration
- Detailed display of frequency range (adjustable limits)

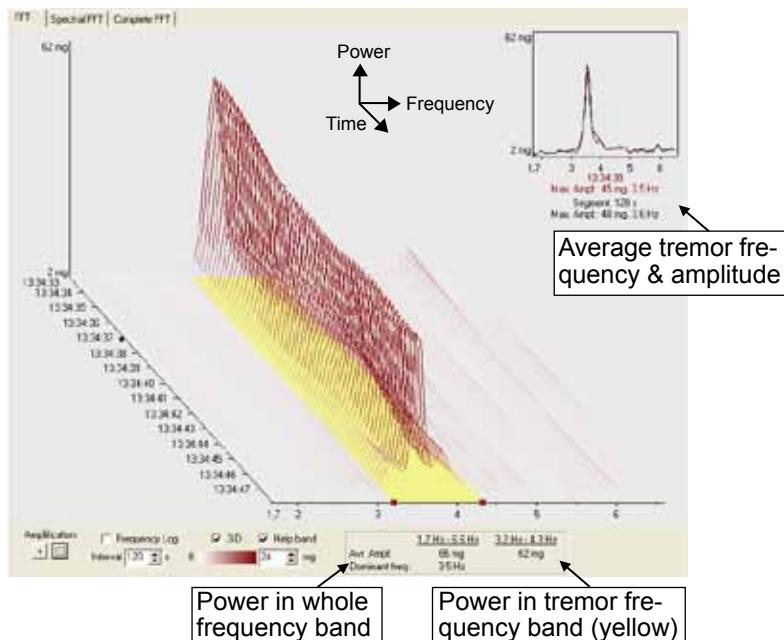

## SOMNOwatch™ plus Tremor

- ▶ Recording duration up to 13 days
- ▶ Saves x, y, z-raw data with 128 Hz
- ▶ Easy handling for Patient & Physician
- ▶ Simultaneous Measurement of Tremor on various Limbs
- ▶ External EMG- or Actigraphy Sensor applicable

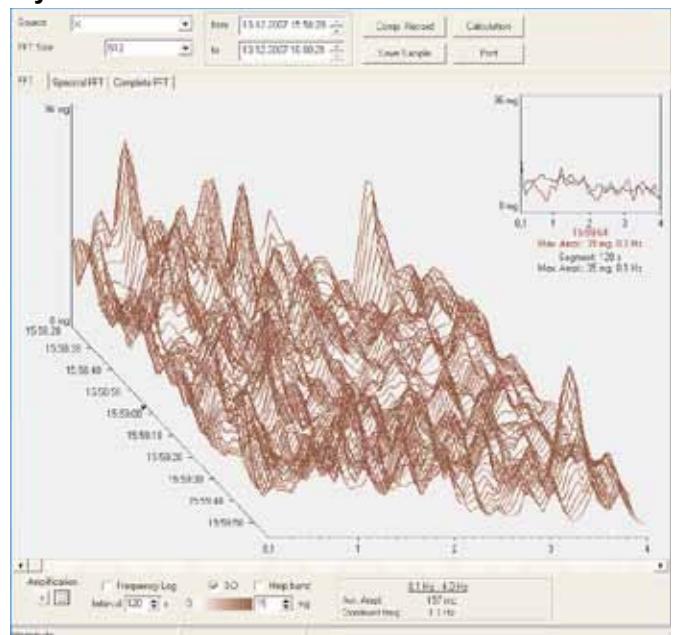

## Differentiated Diagnostics through 3D-frequency Analysis<sup>2</sup>

### Tremor

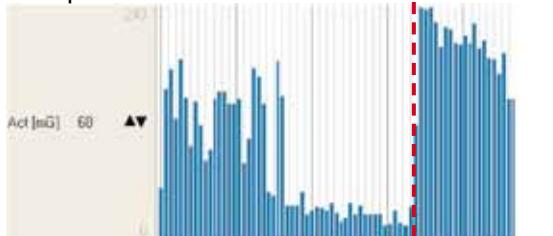

### Dyskinesia

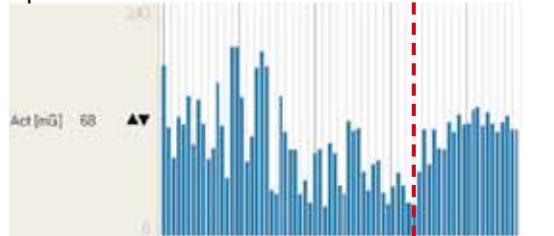

## Optimization of medicinal treatments<sup>1</sup>

not optimized:

Medication

optimized:

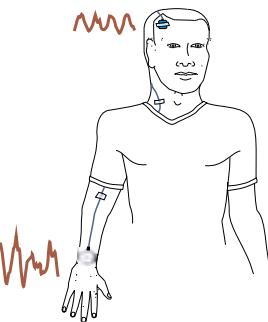

Medication

Determination of general Bradykinesia, fluctuations of motility during the day and Hyperkinesia

## Automatic Analysis Software

- Spectral analysis for determination of tremor frequency
- Easy determination of frequency and power in the tremor frequency band
- Quick results, tabular or graphical
- Export to EXCEL

## Simultaneous measurement of head and hand tremor through external sensor

7 internal channels
Body position, 3 activity sensors (x, y, z-axis, magnitude), ambient light, patient marker
Data Collection
Adjustable sampling rate up to 128/s, small filesizes thanks to compressed data storage
Power supply
Li-Ion battery, 630mAh, rechargeable
Size and weight
45 mm diameter x 16 mm (incl. battery, 30 g)
Device functions
Recording duration up to 13 days with 32 Hz
Charging of battery and data transfer via docking station
Programmable start- and stop-times, delayed auto-start
splashproof
